

SUMMARY

Senior Data Engineer with 10+ years of experience with data, including 3+ years designing and building production data platforms, ETL/ELT pipelines, and analytics solutions across complex operational environments. Experienced in transforming fragmented data sources into reliable, governed datasets through scalable workflows, data modeling, automation, and quality-driven engineering practices. Proven ability to bridge technical and business needs by building maintainable data solutions driven by downstream business requirements that improve data reliability and drive informed decision-making.

SKILLS

Languages & Frameworks: SQL, Python, dbt, Apache Spark (PySpark)

Data Engineering & Architecture: ETL/ELT Pipelines, API Integration, Data Modeling, Data Quality Validation, Data Lakehouse Architecture, Data Observability/Monitoring, Data Governance & Documentation

Cloud & Data Platforms: Snowflake, Databricks, AWS (S3, Lambda, Glue, EC2, Athena), GCP (Cloud Run, Pub/Sub, Firestore)

Analytics & Visualization: Power BI, Looker, KPI Development, Data Storytelling, Apache Superset

EXPERIENCE

Principal Business Analyst (Data Engineering Lead) | San Joaquin County Probation | March 2023 - Present

- Architected and maintained the department's production data orchestration framework using 30+ Python ETL pipelines that integrate fragmented operational and cloud data into a centralized warehouse. Built reusable ingestion and transformation workflows with automated validation, logging, error handling, and retries to standardize inconsistent source data and deliver trusted analytical datasets supporting 70+ tables.
- Established a governed analytics ecosystem by delivering trusted, production-ready data products consumed by automated Power BI solutions across multiple business functions. Enabled self-service analytics, eliminated 70+ hours of monthly manual data preparation, and reduced reliance on third-party analytics services by avoiding \$160K+ in annual contract costs.
- Led the modernization of legacy ETL and reporting workflows into a cloud-based ELT architecture using Snowflake and dbt, designing a scalable source-to-mart transformation layer with modular models, automated data quality tests, documentation, and enhanced pipeline observability. Improved data reliability, maintainability, and development velocity by replacing brittle legacy processes with a governed, testable, and scalable analytics engineering framework.
- Led a five-person data team responsible for analytics, reporting, data engineering, and warehouse development. Established engineering standards, data practices, and team workflows that improved collaboration, code quality, and delivery consistency while mentoring analysts in SQL, Python, data modeling, and automation.
- Improved enterprise data quality by implementing automated validation, reconciliation, and standardized transformation logic across multiple operational systems, increasing confidence in executive reporting and reducing recurring data discrepancies.
- Produced statistical program evaluations and performance analyses that informed executive leadership, supported policy decisions, and monitored program effectiveness across county probation initiatives.
- Managed sensitive criminal justice data within a regulated environment, ensuring strong data governance, privacy controls, audit readiness, and data integrity across enterprise reporting systems.

Data & Systems Consultant | Jesus Said Go | August 2025 - Present

- Designed and implemented a production AWS data platform, replacing legacy CRM reporting with automated API ingestion and governed Bronze/Silver/Gold layers using Lambda, S3, Glue, Apache Iceberg, and Athena; self-hosted Superset on EC2 with dashboards, scheduled reporting, and an AI chatbot for natural-language data analysis, reducing manual reporting and improving access to timely insights.
- Architected API-based integration workflows connecting CRM systems with external applications, implementing

automated data ingestion and outbound data exchange processes to synchronize operational data, improve interoperability, and support scalable workflows.

Business Analyst (Senior Data Analyst) | San Joaquin County Probation | December 2014 – March 2023

- Developed enterprise reporting and self-service analytics solutions using advanced SQL, Power BI, Python, statistical analysis, and KPI design, while improving data accuracy and rectifying inconsistencies in external and operational reporting across multiple business units.
- Automated 20+ recurring reporting and data extraction processes using Python, SQL, and VBA, eliminating hundreds of hours of manual reporting annually while improving consistency and reducing operational risk.
- Enhanced CRM workflows and data processes during a department-wide system transition, improving data quality, streamlining operational workflows, and increasing user adoption. Recognized by users and leadership for reducing system friction and improving the overall user experience.
- Developed an NLP-based machine learning model analyzing probation case notes to predict client outcomes with 89% accuracy, demonstrating the potential to proactively identify high-risk cases and support data-informed intervention strategies.

PROJECTS

Etsy Shop ELT Pipeline [[Github](#)]

- Designed and deployed a fully automated cloud-native ELT pipeline that extracts incremental sales and fulfillment data from Etsy and Gelato APIs via AWS Lambda, stores raw JSON in partitioned Amazon S3, ingests into Snowflake using Snowpipe, and transforms it with dbt into a dimensional star schema with automated data quality tests and scheduled warehouse builds via Snowflake Tasks.

NonProfit Website Clickstream Pipeline & Analytics [[Github](#)]

- Designed and implemented a production clickstream pipeline using event-driven architecture with JavaScript, Google Cloud Run, Pub/Sub, Firestore, BigQuery, and Looker to capture and handle anonymized website engagement events and deliver session-level analytics.

Earthquake ETL Lakehouse Pipeline | [[Github](#)]

- An end-to-end PySpark + Delta Lake pipeline in Databricks ingesting real-time USGS earthquake API data into Bronze/Silver/Gold medallion layers with incremental metadata tracking, optimized analytic tables, and visualization outputs for reporting.

Powerlifting Data Analysis & Visualization | [[Github](#)]

- Extracted, cleaned, and feature-engineered OpenPowerlifting competition data in Python, storing results as Parquet files. Explored data for insights and produced an interactive Power BI dashboard to analyze trends and participant performance.

EDUCATION & CERTIFICATIONS

B.S. Mathematics

- California State University – Stanislaus | December 2013

Power BI Data Analyst Associate

- Microsoft Certified ([Credly Badge](#)) | December 2022
